NEW INNOVATIVE SOLUTIONS WITHIN ETTEPLAN GROUP

Cool Engineering AB, a part of Etteplan Group offers testing and analysis services to add energy efficiency and to improve emission control. The company serves customers manufacturing trains, mobile working machines, engines and cars. Through its strong competence in energy efficient solutions Cool Engineering AB has lately received several new assignments from new customers and business areas.

"It is truly interesting to see how our experience and wide competence within testing and analyses, data acquisition as well as test equipment for vehicle industry can also be applied with new customers in other business areas", says Arvo Siösteen, Managing Director of Cool Engineering AB.

One of the recently delivered products is operations desk with in-built climate equipment developed for CGM AB. The assignment included structure development of both software and hardware as well as testing of climate system. The product development outcome is an operators desk with micro climate which can be adjusted by the user. The user is able to adjust different temperatures for upper and lower body according to personal needs and work situation. In a critical situation the system itself can lower the temperature with some degrees which helps the operator to be more alert and to make the right decisions the situation requires.

"We develop state-of-the-art control rooms and are market leaders in our line of business" says Pierre Schäring, Managing Director of CGM AB. "Current control rooms have a lot to be improved and also potential. By creating a good working environment with right temperature, good ergonomics and integrated systems for operators the productivity increases and risks for expensive standstills or accidents decreases. Cool Engineering's experience and competence within climate solutions has been an important part in development work of our new operations desk", continues Pierre Schäring.
